

As a high school student suffering from severe near-sightedness, to own a pair of smart glasses would be a dream come true. Imagine the benefits this product would bring — the ability to see through objects, and simultaneously recording everything in my life from my vantage point! This could highly raise my awareness to my surroundings; for example, if ever I linger outside too late in the night, I wouldn't have to compulsively peer around every corner of the street while walking home, or make a 400-meter dash from the MRT station to my house, because if there were any perverts lurking behind any buildings, I'd easily spot them with my trusty smart glasses! With this product, I could also

### 背面可繼續作答

conveniently record the appearances of these stalkers and provide evidence for the police. Another great way I could put these spectacles to good use is replay specific segments of my life so that I could relive every heartfelt conversation, every blossoming of a friendship, and every time I scored a point in a soccer game. If people could watch a montage of the cherished moments in their lives in which they felt genuinely happy, we'd all be more thankful for this life that we were blessed with.

Though on an impulse I wanted to pick the invisibility cloak over smart glasses, I knew deep inside I couldn't be trusted with this invention. If ever anyone annoys me, I'd don this cloak with pure vengeance in mind and do hurtful things, such as sticking my invisible foot out and trip them. This invention could also cause severe problems to society on a larger scale; for example, burglars could easily slip into one's home in broad daylight, and jailbirds on the loose could live the rest of their lives in peace so long as they're hidden by an invisibility cloak. Danger could be lurking right in front of you and you wouldn't even suspect a thing. In conclusion, invisibility cloaks should only exist in children's tales such as Harry Potter, because the harm they'd bring to today's society is unfathomable.
