

According to this graph, I find several phenomena that are quite special. American senior high school students seem to spend more time sleeping or taking part in leisure activities. They spend about eight or nine hours sleeping and it takes them three or four hours to do leisure activities or join in social activities. They also spend some time taking part-time job, playing sports, and doing volunteer work. It seems that they spend time effectively and they don't totally focus on school work. They do more things and they do not place so much emphasis on studies as we.

On the whole, my time assignment is similar to the graph, but there are still some differences. I spend about ten hours on my academic work and lesser time sleeping, playing, or resting. I

背面可繼續作答

spend little time taking part-time job or doing volunteer work. In my opinion, Taiwanese ^{people} place more emphasis on academic performances, so we tend to spend more time studying. I think extracurricular activities such as social, leisure or volunteer activities are less important than schoolwork. I want to do them after the entrance exam. In this stage, I only want to study hard and get admitted to a prestigious university. Therefore, I spend more time studying and getting more knowledge. On the other hand, American students think every aspects of life is equally important. Thus, they do more activities and spend more time on them. In a nutshell, it's the cultural differences and values that lead to such difference and phenomenon. There is no telling which one is better or worse. What we have to do is respect ^{each other} and accept the differences among us.
