

As an old saying goes, "A school is a child's second home." Students spend up to eight hours a day or even more at school, therefore, it is of utmost important that we make school a safe learning environment. If the safety of a campus is questionable, students can't study at their best state, thus lead to less efficient learning. The safety problems that may happen in schools can be divided into two categories: people-related and material-related. The former includes accidents on a basketball court, injuries caused by students storming into the auditorium, or careless acts in the laboratory. Most of the problems are results of ruthless behaviors or lack of acknowledgement about the environment. Scrapes, cuts, strangled ankles can be recovered in a few days, while a broken arm or limb may lead to hospital treatment. Secondly, old facilities or buildings can also pose a threat on students. Chairs that haven't been fixed, doors and windows that don't function well, or stairs that are slippery all the time are just a few examples of dangerous objects. Also, spoiled food or snacks may also lead to sickness.

As a student, I think everyone should do their own part to maintain the safety of our campus. First of all, we should always be cautious. No matter where we are, it is important to observe the environment and look for places or objects that are faulty or dangerous. This may sound easy, but having a good understanding of what is around can reduce the possibility of accidents such as stepping into a hole or being cut by a sharp piece of metal. While we acknowledge those potential threat, we should report the problem to teachers or the school. By doing this, the problem can be fixed or at least dealt with so less people would be harmed. Secondly, never rush. Running in the hallways, playing sports in crowded places, or walking very fast down the stairs are behaviours that can be prevented by rules in order to create a safer place to learn. Though restricting students' freedom is never pleasant, it's for a greater cause. Lastly, we should keep the place tidy. When doing an experiment or an activity, there are usually many fragile objects around. If we let those instruments unattended, they can easily break and hurt people. School safety is important, by doing the smallest things, we can prevent even the biggest harm.
